

Getting new and interesting Fonts into Halo by: Random

Step one: Find what font you want in halo, you can find many new custom fonts online for download or just use the ones that came with windows.

Step two: Open up good old Tool and type "tool windows-font"

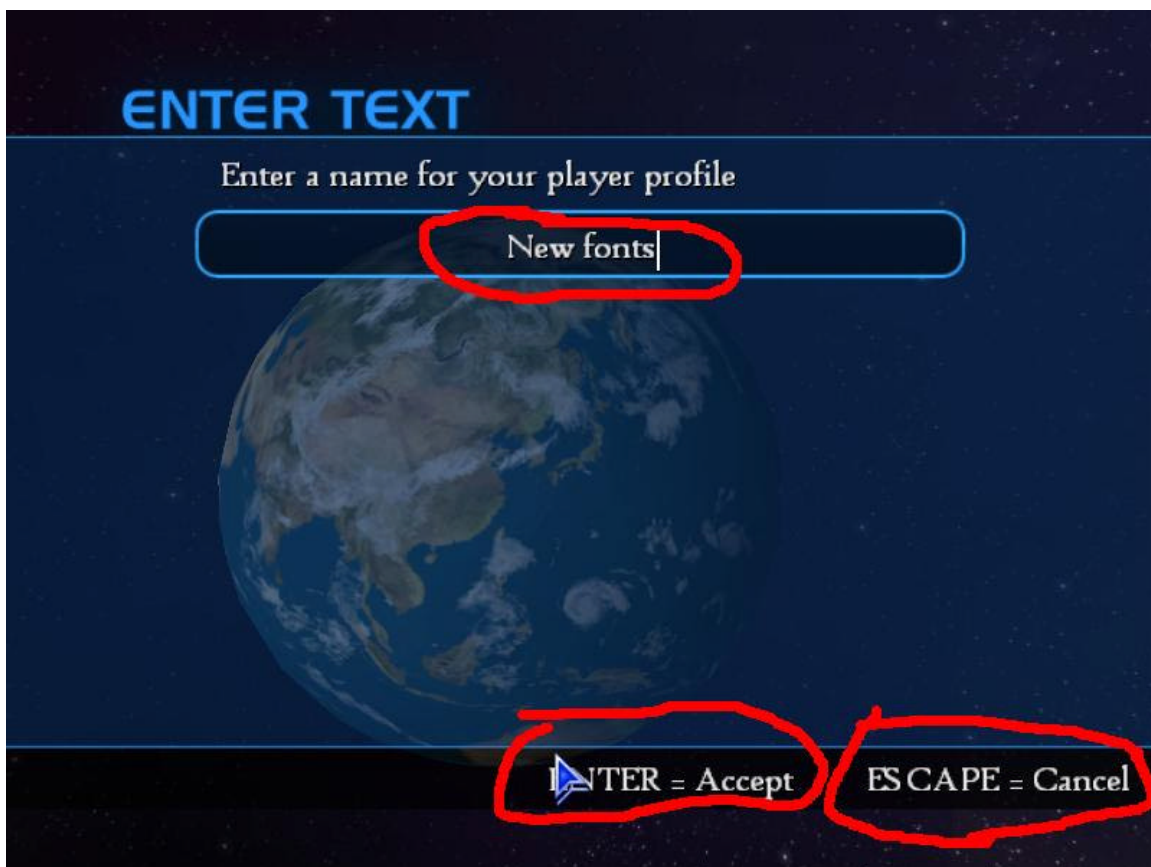

Step three: A cool little window will pop up and in there you will pick your font, the font size, and how the font will look. If you want big font in halo make the size of the font in this window bigger.

Step four: Create a back up of large\_ui.font and rename the new font you just compiled large\_ui.font. (You can replace any font you want, by creating a back up and saving your new font with the name of the font you are coping.)

Step Five: Compile your ui or map and enjoy.

Optional, you can change the color of the text in widgets, but it will not change everything using the font to the color you choose.

Here are some examples of what I did.
